

Project Diana is a stereo BBD (Bucket-Brigade Device) full **analog** audio path delay, featuring six individual **presets**, liquefied tape-like modulation, **tap tempo** control and 550ms delay time.

Designed with **custom** anti-aliasing reconstruction filter, the two re-issued versions of the legendary MN3005 delay chips produce **warm** tight slap back echoes and long deep end delay tones.

Each knob is controlled by a small microprocessor while your guitar signal stays **100% analog** and never gets digitally processed. This **unique** concept allows you to control, save and recall multiple delay tones instantly.
